Network Programming

Lab 1

1. Getting Start

1.1. Install Python

You can download and install the latest version of Python [here](#).

1.2. Install IDE

The two most popular IDEs for running Python are PyCharm, VSCode.

1.3. Create and run your first program

To get started with PyCharm, please follow the instructions provided [here](#).

To get started with VScode, please follow the instructions provided [here](#)

2. Assignments

2.1. Assignment 1

Let the user enter two integers: x and y. Calculate the sum of the two variables and print it to the terminal

2.2. Assignment 2

Let the user enter values. Calculate the average of two variables (z): float x and integer y, print the result (z) and also the type of it.

2.3. Assignment 3

Given an array of numbers from 1 to 10. Calculate and print the sum of even and odd numbers.

2.4. Assignment 4

Given an array of random numbers: 2, 6, 9, 15, 21, 28, 30, 33. Suppose that the user enters any number, find and print the closest number to the given number and calculate the distance of it.

2.5. Assignment 5

Suppose there is a "student" dictionary containing keys (name, course, point)

```
student = { "name": "Your name",
```

```
course": "CSE306",
```

```
"point": 0
```

```
} update its value by coding and adding a new key ("GPA": 3.2), delete the "point"key to the student dictionary. Print the result.
```
